Fundamentals of Semiconductor Devices
EE3329, Spring 2020
University of Texas at El Paso

Instructor: David Zubia, Ph. D.          Office Hours:
Office: A335                  M and W: 10:30 - 12:00
Voice: 747-6970               Other hours by appointment
Email: dzubia@utep.edu

Course Description:
This course deals with the analysis and design of electronic devices. In order to analyze and design these
devices, detailed knowledge of semiconductor physics is needed. Therefore, the course will begin with
treatment of semiconductor physics. The second part of the course will focus on applying knowledge of
semiconductor physics to electronic devices. Devices that will be covered include diodes, field-effect
transistors and bipolar junction transistors. Device physics will be used to relate internal charged-carrier
behavior with external terminal characteristics of the devices.

Electronic devices are used in circuits to make complex analog and digital functions such as amplifiers (for
audio, high-frequency, wireless, etc) and microprocessors. This course is fundamental to electrical
engineering and will benefit persons in all areas of concentration especially solid-state devices and
materials, electronics engineering, and computer engineering.

Emphasis is placed on group discussion and individual work, and lectures to clarify points. Reading and
homework will be assigned. Knowledge and skill development obtained by working on assignments will be
assessed through quizzes and exams. It is through reading, working on assignments and class discussions
that most learning will occur. The instructor’s role will be to guide you by discussing relevant topics and
assigning problems that will require you to go through the mental steps necessary to obtain knowledge and
learn problem-solving skills. The instructor’s role will also be to assess your progress and give you
feedback.

Learning Objectives:
After completion of this course, students should be able to:
1. Apply semiconductor physics to analyze electronic devices including; resistors, capacitors, diodes,
field-effect transistors, and bipolar junction transistor.
2. Apply the design process to create and evaluate devices to meet specified requirements.
3. Apply ordinary differential equations to describe behavior of electronic devices under different
initial and boundary conditions.

Topics Covered:
- Crystal structure
- Energy bands in crystals
- Carrier transport in semiconductors
- p-n junction diodes
- Bipolar junction transistors
- Field-effect transistors
Textbook: Required

Grading and Policies:
A: 90% - 100%  B: 80% - <90%  C: 70% - <80%  D: 60% - <70%  F: 0 - <60%

Late course work will not be accepted.
No make-up work will be given.

Prerequisite: PHYS 3325 (or EE 4395 Applied Quantum Mechanics for EE’s) and EE 3321 each with grade of “C” or better.

Syllabus Changes: Some of the content in the syllabus is subject to change for improvements or other factors. Any changes will be communicated.

Academic Dishonesty:
Incidents of academic dishonesty will be referred to the Director of Electrical Engineering and the Dean of Students.
