Course Description

Why study science? Science helps us understand the world around us. Everything we know about the universe, from how volcanoes form to what an atom is made up of, is the result of scientific research and experimentation. The Earth is fundamental to life as we know it today. How we got here, the mountains, oceans, organisms, and our interaction with one another is the focus of this course. In addition, for many there is a natural curiosity about how Earth processes work and how humans may or may not be responsible for changing those processes in ways that will alter our lives
